Nangarhar University

February 28, 2018

Agenda

- 1 Introduction
- 2 Language Fundamentals
 - Basic Operators
 - Data Types
 - Sequence Types
- 3 Functions in Python
- 4 Classes and Objects in Python
- 5 Questions and Discussion

Programming with Python

- *Guido van Rossum* created the Python programming language in late 1980s
- Python strives to provide simple but powerful syntax
- Used at Google, Yahoo, Facebook, and NASA etc.
- In late 2008, Python 3.0 was released, earlier version 2.0

Python program execution

- Using Interactive Interpreter
 - `>>> 5+5`
 - `>>> 10`
- Using a text editor and then interpret it using Python interpreter
 - edit your code in a file with extension **.py**
 - `python abc.py`
 - or use shebang (`#!` path to the python interpreter) notation on the first line (`#! /usr/bin/env python`)

A code sample

- `print "great language"`
- `print('great language')`
- `x = 35`
- `if x == 35 and 1==1:`
 `print 'True'`
`elif x == 1:`
 `print 'One'`
`else:`
 `print 'Nothing'`

Agenda

- 1 Introduction
- 2 Language Fundamentals
 - Basic Operators
 - Data Types
 - Sequence Types
- 3 Functions in Python
- 4 Classes and Objects in Python
- 5 Questions and Discussion

Some operators

- `=` is for assignment, and `==` is for comparison
- `+`, `-`, `*`, `/`, `%` are for arithmetic
 - special use of `+` for string contention
 - special use of `%` for string formatting
- instead of symbols words (`and`, `or`, `not`) are used as logical operators
- `print` is basic printing command
- The first assignment to variable creates it

Agenda

- 1 Introduction
- 2 Language Fundamentals
 - Basic Operators
 - Data Types
 - Sequence Types
- 3 Functions in Python
- 4 Classes and Objects in Python
- 5 Questions and Discussion

Basic Data Types

- **Integers** (default for numbers)

`z = 7/3`

- **Floats**

`z = 3.5`

- **Strings**

`'xyz' "xyz"`

Agenda

- 1 Introduction
- 2 Language Fundamentals
 - Basic Operators
 - Data Types
 - Sequence Types
- 3 Functions in Python
- 4 Classes and Objects in Python
- 5 Questions and Discussion

Sequence Types

- **Tuples** a simple *immutable* ordered sequence of items, items can be of mixed types, including collection types

```
>>> tup = (10, 18, 'xyz', (3,5), 5.6, 'fet')
```

- **List** mutable ordered sequence of items of mixed types

```
>>> lst = ['xyz', 5, 2.5]
```

- **Strings** immutable, conceptually very much like a tuple, strings are defined using quotes(" , ' , """)

```
>>> str = "some's string"
```

```
>>> str = 'some string'
```

```
>>> str = """some multi-line  
string"""
```

Sequence Types –continue

- individual members of *tuple*, *list*, and or *string* can be accessed using bracket "array" notation

```
>>> tup = (10, 18, 'xyz', (3,5), 5.6, 'fet')
```

```
>>> tup[1] # Second item in the tuple
```

```
18
```

```
>>> lst = ['xyz', 5, 2.5]
```

```
>>> lst [1] # Second item in the list
```

```
5
```

```
>>> str = "some's string"
```

```
>>> str[1] # Second character in string
```

```
'o'
```

White spaces

Whitespaces has meaning in Python; especially indentation and newline

- **newline** indicates a new statement
- use consistent indentation to mark blocks
 - first line with **less** indentation is outside of the block
 - the first line with **more** indentation starts a nested block
- Often a colon appears at the start of a new block (e.g. for loops, decisions, functions and class definitions.)

Functions

- **def** creates a function and assigns it a name
- arguments are passed by assignments
- **return** sends a result back to the caller
- arguments and return types are not declared

function definition syntax

```
def <name> (arg1, arg2,....., argN):  
    <statements>  
    return <value>
```

```
def add (a,b):  
    return a+b;  
add (5,6)  
11
```

Classes and Objects

class and object example

```
class <name> (object):  
    <member functions and variables>
```

```
class calculator (object):  
    def __init__ (self,a,b):  
        self.a=a  
        self.b=b  
    def add (self):  
        return self.a + self.b  
    def mul (self):  
        return self.a * self.b
```

```
cal = calculator(4,9)  
cal.add()  
cal.mul()
```

Your Turn: Time to hear from you!
